Kuramoto coupling as the bifurcation parameter — 26 economies, real GDP, annual
A · Coupling loads far above critical, then falls back to it
implied coupling K/K$_c$ (log)
1975
1982
1991
2009
2020
mean
K = K$_c$ (transition)
years relative to global-recession onset
B · Recovery rate shows no slowing (λ flat)
recovery rate λ
years relative to onset
C · vs 5,000 surrogate economy sets: no slowing
5% chance level
real +0.10 (p=0.54)
Δλ (post-crisis − baseline); negative = slowing
